

Development ALUWAG

ALUWAG

Trial connecting rod

Over the last few years, we have been working hard to develop special materials in die casting. The wide range of special materials offering higher chemical and physical properties, as against standard materials, have allowed us to realize development projects with highest requirements.

The connecting rods are manufactured in the die casting process and heat treated. It demonstrates the high elongation at increased strength of the ALUWAG material.

With the special materials, we have implemented projects in the powertrain, steering range and also car bodies (safety component).
